Equations are centered at the moment. In math's papers and on the phone they will be aligned to the left, it would be better to have them on the left.

Look at how the data is structured in the JSON format, each content section can have either text or equation or images (hypothetically). This means that you need to label each thing.

There's no delete button, and for example when I created 'additional info' by accident, I can't delete it.

I'm skeptical about the inline stuff with the equation editor. Does that mean that if I have to put an 'x' in just one place of a long line of text, I have to use the 'add equation button' not the add text button, which would be more intuitive. Maybe if there was some way to switch the contexts if I realised that I needed to switch modes?
